# New Triterpenes from Gymnema sylvestre 

by Armando Zarrelli ${ }^{\text {a }}$ ), Marina DellaGreca* ${ }^{\text {a }}$ ), Afef Ladhari ${ }^{\text {b }}$ ), Rabiaa Haouala ${ }^{\text {c }}$ ), and Lucio Previtera ${ }^{\text {a }}$ )<br>${ }^{\text {a }}$ ) Department of Chemical Sciences, University Federico II, Complesso Universitario Monte S. Angelo, Via Cintia 4, IT-80126 Napoli (phone: +39-081-674472; fax: + 39-081-674393; e-mail: dellagre@unina.it)<br>${ }^{\text {b }}$ ) Department of Biology, Faculty of Science of Bizerte, Jarzouna 7021, Tunisia<br>${ }^{c}$ ) Department of Biological Sciences and Plant Protections, Higher Institute of Agronomy of Chott Meriem, University of Sousse, 4042, Tunisia (UR03AGR04)

Phytochemical investigation of the aerial parts of Gymnema sylvestre has led to the isolation of seven new triterpenes, six oleane types (5, 7-11) and a new lupane type (12), and of the six known analogues $\mathbf{1 - 4 , 6}$, and 13. The structures and relative configurations of these compounds were elucidated by spectroscopic analyses, including 1D- and 2D-NMR spectroscopy and mass spectrometry, and by the comparison of their NMR data with those of related compounds.

Introduction. - Gymnema sylvestre is a bushy climber of the Asclepiadaceae family that is found mainly in the Central and Tropical Indian Peninsula, Sri Lanka, and Africa. It is considered a medicinal plant and is used in folk medicine, ayurveda, and homeopathy for treatment of asthma, eye disorders, inflammation, and snake bites, as a tonic and refrigerant, diuretic, laxative, sedative for coughs, and especially as an antidote for diabetes [1]. Recent studies, based on the historical evidence of the many uses in the medicinal field, have indicated that the leaves and roots of the plant are the parts that contain the biologically active ingredients [2]. The active compounds of $G$. sylvestre are called gymnemic acids [3]. Their use in the past to counteract the effects of excess glucose in diabetes mellitus explains the Hindi name of the plant, 'Gur-ma' which means 'destroyer of sugar'. The plant extracts have been reported to exert an antimicrobial and hepatoprotective activity, and to lower the levels of triglycerides and LDL cholesterol, and raise the HDL cholesterol ('good cholesterol') [4][5]. They also act as a deterrent against Prodenia eridania, prevent dental caries caused by Streptococcus mutans, and are used in skin cosmetics [6-8].

In an investigation of G. sylvestre, we have isolated five known oleanane-type triterpenes, $\mathbf{1 - 4}$ and 6, six new analogs, 5 and 7-11, and two lupane-type triterpenes, 12 and 13 , the former of which was new.

Results and Discussion. - The $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ extract of the aerial parts of G. sylvestre was separated into acidic and neutral fractions with 2 N NaOH . The neutral fraction, washed with $\mathrm{H}_{2} \mathrm{O}$ and concentrated under reduced pressure, was filtered through $\mathrm{SiO}_{2}$ with petroleum ether, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{AcOEt}, \mathrm{Me}_{2} \mathrm{CO}, \mathrm{MeOH}$, and $\mathrm{H}_{2} \mathrm{O}$, as eluents of increasing polarity. Column chromatography of the fraction eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ yielded

compounds $\mathbf{1 - 1 3}$. The known triterpenes $\mathbf{1 - 4 , 6}$, and $\mathbf{1 3}$ were identified as $3 \beta, 16 \beta, 28-$ trihydroxyolean-12-ene (1) [9], $3 \beta, 16 \beta, 21 \beta, 28$-tetrahydroxyolean-12-ene (2) [10], $3 \beta, 16 \beta, 22 \alpha, 28$-tetrahydroxyolean-12-ene (3) [11], $3 \beta, 23,28$-trihydroxyolean-12-ene (4) [12], $3 \beta, 16 \beta, 21 \beta, 23,28$-pentahydroxyolean-12-ene (6) [13], and $3 \beta, 16 \beta, 29$-trihy-droxylup-20(30)-ene (13) [14].

The new compounds were characterized by various spectroscopic methods. The ESI-MS of compound 5 showed a quasi-molecular-ion peak at $m / z 475.2\left([M+\mathrm{H}]^{+}\right)$, suggesting the molecular formula $\mathrm{C}_{30} \mathrm{H}_{50} \mathrm{O}_{4}$ and six degrees of unsaturation. Fragment ions at $m / z 457.5\left(\left[M-\mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}\right), 439.3\left(\left[M-2 \mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}\right)$, and retro-Diels-Alder fragmentation ion, characteristic of an oleanane skeleton, at $\mathrm{m} / \mathrm{z} 250.4$ (50\%) evidenced an olean-12-ene derivative. The ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR spectra of 5 confirmed this assumption. The ${ }^{1} \mathrm{H}$-NMR spectrum showed signals of five H -atoms geminal to an O-bearing function as three double doublets at $\delta(\mathrm{H}) 4.10,3.61,3.52$, a doublet at 3.53, and a signal at $\delta(\mathrm{H}) 3.31$, partly obscured by solvent. The ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectrum (Table) exhibited signals of three O-bearing CH groups at $\delta(\mathrm{C}) 74.5,74.3,67.8$ and of a Obearing $\mathrm{CH}_{2}$ group at $\delta(\mathrm{C}) 67.8$. In the upfield region of ${ }^{1} \mathrm{H}-\mathrm{NMR}$, seven Me singlets were detected at $\delta(\mathrm{H}) 1.23,1.02,1.01,0.95,0.87,0.81$, and 0.71 . The analysis of COSY, NOESY, HSQC, and HMBC spectra allowed us to determine the structure of $3 \beta, 16 \beta, 21 \beta, 23$-tetrahydroxyolean- 12 -ene for this compound. The ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}$-COSY experiment showed correlations between $\mathrm{H}-\mathrm{C}(16)(\delta(\mathrm{H}) 4.10)$ and $\mathrm{CH}_{2}(15)(\delta(\mathrm{H}) 1.67$ and $1.25)$; $\mathrm{H}-\mathrm{C}(21)(\delta(\mathrm{H}) 3.52)$ and $\mathrm{CH}_{2}(22)(\delta(\mathrm{H}) 1.68$ and 1.60$)$; and $\mathrm{H}-\mathrm{C}(3)(\delta(\mathrm{H})$

Table. ${ }^{13} \mathrm{C}$-NMR Data of Triterpenes 5, 7-12 (at 125 MHz , in $\mathrm{CD}_{3} \mathrm{OD} ; \delta$ in ppm)

${ }^{\text {a }}$ ) obs: Obscured by the solvent.
3.61) and $\mathrm{CH}_{2}(2)\left(\delta(\mathrm{H}) 1.96\right.$ and 1.93). The latter correlated with the $\mathrm{CH}_{2}(1)(\delta(\mathrm{H})$ $1.65,1.16)$. Finally, the signal of the olefinic H -atom $\mathrm{H}-\mathrm{C}(12)$ at $\delta(\mathrm{H}) 5.28$ correlated with $\mathrm{H}-\mathrm{C}(11)(\delta(\mathrm{H}) 1.96$ and 1.93). The correlations in the HMBC experiment between the H -atom signal at $\delta(\mathrm{H}) 4.10$ and that of the H -atoms of $\mathrm{Me}(28)$ at $\delta(\mathrm{H})$ 0.81 with the CH signal at $\delta(\mathrm{C}) 50.5$, assigned to $\mathrm{C}(18)$ and bonded to H -atom with the signal at $\delta(\mathrm{H}) 2.20$, and between the signal of $\mathrm{H}-\mathrm{C}(18)$ with that of the O-bearing $\mathrm{H}-\mathrm{C}(16)$ at $\delta(\mathrm{C}) 67.8$, indicated an OH group at $\mathrm{C}(16)$. The correlations between the signals of $\mathrm{H}-\mathrm{C}(23)$ at $\delta(\mathrm{H}) 3.53$ and 3.31 with that of the CH at $\delta(\mathrm{C}) 48.5$, assigned to $\mathrm{C}(5)$ and bonded to the H -atom with the signal at $\delta(\mathrm{H}) 1.62$, and between this signal and that of the O-bearing $\mathrm{CH}_{2}$ at $\delta(\mathrm{H}) 67.8$ localized another OH group at $\mathrm{C}(23)$. Finally, the correlations of the signals of two geminal Me groups, i.e., $\mathrm{Me}(29)$ at $\delta(\mathrm{H})$ 0.95 and $\mathrm{Me}(30)$ at $\delta(\mathrm{H}) 0.87$, with the C -atom signal at $\delta(\mathrm{C}) 74.5$ defined a further hydroxylation site at $\mathrm{C}(21)$. These data, compared with those of the other isolated triterpenes, were in accordance with a 3,16,21,23-tetrahydroxyoleanane skeleton. The
configurations of the OH groups were deduced from a NOESY experiment (Fig.), where $\mathrm{H}-\mathrm{C}(16)$ showed NOE effects with the H -atoms of $\mathrm{Me}(27)$ and H -atom $\mathrm{H}-\mathrm{C}(19)(\delta(\mathrm{H}) 2.10)$, indicating a $\beta$-orientation for the OH group at $\mathrm{C}(16)$. The $\mathrm{H}-\mathrm{C}(21)$ showed NOE effects with the H -atoms of $\mathrm{Me}(29), \mathrm{H}-\mathrm{C}(19)$, and $\mathrm{H}-\mathrm{C}(16)$ indicating also a $\beta$-orientation for the OH group at $\mathrm{C}(21)$.

Figure. Key NOE correlations for compound $\mathbf{5}$

The ESI-MS of compound 7 showed a quasi-molecular-ion peak at $m / z 491.4$ ([ $M+$ $H]^{+}$), suggesting the molecular formula $\mathrm{C}_{30} \mathrm{H}_{50} \mathrm{O}_{5}$ and six degrees of unsaturation. Fragment-ion peaks at $m / z 473.4\left(\left[M-\mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}\right), 455.3\left(\left[M-2 \mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}\right)$, and retro-Diels-Alder fragmentation-ion peak, characteristic of an oleanane skeleton, at $\mathrm{m} /$ $z 267.5(30 \%)$ evidenced an olean-12-ene derivative. The ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR data were similar to those of triterpene $\mathbf{6}$, whose structure had been previously reported in [13]. A concise analysis of its spectroscopic data allowed us to determine the structure of $\mathbf{7}$ as the $C(21)$-epimer of the reference compound 6 . The ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}$-COSY experiment showed correlations between: the double doublet $\mathrm{H}-\mathrm{C}(16)$ at $\delta(\mathrm{H}) 4.57$ and the $\mathrm{CH}_{2}(15)$ at $\delta(\mathrm{H}) 1.80$ and 1.30 , the broad triplet $\mathrm{H}-\mathrm{C}(21)$ at $\delta(\mathrm{H}) 3.52$ and the $\mathrm{CH}_{2}(22)$ at $\delta(\mathrm{H})$ 2.14 and 1.77, abd the double doublet $\mathrm{H}-\mathrm{C}(3)$ at $\delta(\mathrm{H}) 3.62$ and the $\mathrm{CH}_{2}(2)$ at $\delta(\mathrm{H})$ 1.71. The correlations in the HMBC experiment between the two geminal Me (29) and $\mathrm{Me}(30)$ at $\delta(\mathrm{H}) 0.92$ and 0.95 , respectively, with C -atom at $\delta(\mathrm{C}) 76.2$ indicated a hydroxylation site at $\mathrm{C}(21)$. The configuration at this C -atom has been defined by a NOE experiment where $\mathrm{H}-\mathrm{C}(21)$ showed NOE effects with both $\mathrm{Me}(29)$ and $\mathrm{Me}(30)$, indicating an $\alpha$-orientation of the OH group. This assumption was supported by the multiplicity of $\mathrm{H}-\mathrm{C}(21)$ signal, which appeared as a broad triplet at $3.52(J=$ 3.0).

The ESI-MS of compound $\mathbf{8}$ displayed a quasi-molecular-ion peak at $\mathrm{m} / \mathrm{z} 475.5$ $\left([M+H]^{+}\right)$, indicating the molecular formula $\mathrm{C}_{30} \mathrm{H}_{50} \mathrm{O}_{4}$ with six degrees of unsaturation. Fragment-ion peaks at $m / z 457.3\left(\left[M-\mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}\right), 439.2\left(\left[M-2 \mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}\right)$ were also detected. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum showed signals of six geminal H -atoms bound to an oxygenated function (two as double doublets at $\delta(\mathrm{H}) 3.72$ and 3.62 , and three as doublets at $\delta(\mathrm{H}) 3.82,3.76$, and 3.54 , and one at $\delta(\mathrm{H}) 3.30$, obscured by the solvent). In the upfield region, six Me singlets were evident at $\delta(\mathrm{H}) 1.26,0.96,2 \times 0.92$, 0.76 , and 0.68 . The ${ }^{13} \mathrm{C}-\mathrm{NMR}$ (Table) showed two O-bearing CH signals at $\delta(\mathrm{C}) 78.2$ and 74.4, and those of two O-bearing $\mathrm{CH}_{2}$ groups at $\delta(\mathrm{C}) 67.9$ and 64.5 . The presence of two $\mathrm{sp}^{2}$ quaternary C -atoms $(\delta(\mathrm{C}) 139.9$ and 129.8 ) indicated a $\mathrm{C}(13)=\mathrm{C}(18)$ bond. Analysis of COSY, NOESY, HSQC, and HMBC spectra allowed us to determine the structure of $3 \beta, 16 \beta, 23,28$-tetrahydroxyolean- 13,18 -ene for this compound. This proposal was confirmed by the HMBC of $\mathrm{Me}(27)$ with the downfield olefinic $\mathrm{C}(13)$ and correlations of $\mathrm{H}-\mathrm{C}(16)$ and $\mathrm{CH}_{2}(28)$ with the upfield olefinic $\mathrm{C}(18)$. The ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}$ -

COSY experiment showed correlations between $\mathrm{H}-\mathrm{C}(16)(\delta(\mathrm{H}) 3.72)$ and $\mathrm{CH}_{2}(15)$ $\left(\delta(\mathrm{H}) 1.98\right.$ and 1.35); and $\mathrm{H}-\mathrm{C}(3)(\delta(\mathrm{H}) 3.62)$ and $\mathrm{CH}_{2}(2)(\delta(\mathrm{H}) 1.63)$. The latter correlated with $\mathrm{CH}_{2}(1)\left(\delta(\mathrm{H}) 1.71\right.$ and 1.05). Finally, H -atoms $\mathrm{CH}_{2}(12)(\delta(\mathrm{H}) 2.72$ and $1.89)$ correlated with $\mathrm{CH}_{2}(11)(\delta(\mathrm{H}) 1.27)$ that correlated with $\mathrm{H}-\mathrm{C}(9)(\delta(\mathrm{H}) 1.59)$. The correlations in the HMBC experiment between $\mathrm{CH}_{2}(23)(\delta(\mathrm{H}) 3.54$ and 3.30) with the C -atom with a signal at $\delta(\mathrm{C}) 49.0$, assigned to $\mathrm{C}(5)$ and bonded to H -atom with the signal at $\delta(\mathrm{H}) 1.18$, and between this H -atom with the C -atom with the signal at $\delta(\mathrm{C})$ 74.4 evidenced a OH group at the $\mathrm{C}(23)$ position. In the NOESY experiment, the $\mathrm{H}-\mathrm{C}(16)$ showed NOE effects with $\mathrm{Me}(27)$ and H -atom $\mathrm{H}_{\alpha}-\mathrm{C}(22)$, strongly suggesting a $\beta$-orientation for the OH group; moreover, one of the H -atoms $\mathrm{Me}(28)(\delta(\mathrm{H}) 3.82)$ showed a NOE with $\mathrm{Me}(26)(\delta(\mathrm{H}) 0.92), \mathrm{H}-\mathrm{C}(12)(\delta(\mathrm{H}) 2.72)$ showed a NOE effect with $\mathrm{CH}_{2}(19)(\delta(\mathrm{H}) 2.35)$, and this latter gave NOEs with $\mathrm{Me}(29)$ and $\mathrm{Me}(30)(\delta(\mathrm{H})$ 0.96 and 0.76 , resp.). The structure of this triterpene was reported some time ago by Shibata et al. [15] as a hydrogenation product of saikogenin A.

The ESI-MS of compound $\mathbf{9}$ showed a quasi-molecular-ion peak at $\mathrm{m} / \mathrm{z} 473.2$ ([ $M+$ $H]^{+}$), suggesting the molecular formula $\mathrm{C}_{30} \mathrm{H}_{48} \mathrm{O}_{4}$ and seven degrees of unsaturation. Fragment-ion peaks at $m / z 455.2\left(\left[M-\mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}\right)$, as well as an absorption band at $3376 \mathrm{~cm}^{-1}$ in the IR spectrum indicated the presence of OH groups. The retro-Diels-Alder fragmentation-ion peak, characteristic of the oleane skeleton, in particular the positively charged $D / E$ ring-fragment peak at $m / z \quad 249.1$ ( $42 \%$ ) and the less abundant, positively charged $A / B$ ring-fragment peak at $m / z 225.4$ (6\%) evidenced an olean-12-ene derivative. The IR spectrum also showed absorption bands at 1118, 1090, and $1045 \mathrm{~cm}^{-1}$, consistent with the presence of HO-C groups, and a band at $1722 \mathrm{~cm}^{-1}$ for the presence of a CO group. The ${ }^{13} \mathrm{C}-\mathrm{NMR}$ (Table) spectrum showed 30 signals, which with the DEPT experiment, revealed the presence of six Me groups $(\delta(\mathrm{C}) 31.8$, $27.9,24.8,18.5,17.8$, and 16.4 ), an olefinic C-atom ( $\delta(\mathrm{C}) 124.4$ ), an O-bearing CH group $(\delta(\mathrm{C}) 68.3)$, and two O-bearing $\mathrm{CH}_{2}$ groups ( $\delta(\mathrm{C}) 69.5$ and 68.5). The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum indicated six tertiary Me groups ( $\delta(\mathrm{H}) 1.28,1.11,1.07,0.98$, and $2 \times 0.93$ ), an O-bearing CH group as double doublet $\left(\delta(\mathrm{H}) 4.28\right.$ ), two O-bearing $\mathrm{CH}_{2}$ groups (two doublets at $\delta(\mathrm{H}) 3.87$ and 3.63), and it exhibited two signals ( $\delta(\mathrm{H}) 3.29$ and 3.38), obscured by the solvent, and a trisubstituted olefinic H -atom signal at $\delta(\mathrm{H}) 5.29$ attributed to $\mathrm{H}-\mathrm{C}(12)$. Analysis of COSY, NOESY, HSQC, and HMBC spectra allowed us to deduce the structure of $16 \beta, 23,28$-trihydroxyolean-12-en-3-one for this compound. The ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}$-COSY experiment showed correlations between: $\mathrm{H}-\mathrm{C}(16)$ $(\delta(\mathrm{H}) 4.28)$ and $\mathrm{CH}_{2}(15)\left(\delta(\mathrm{H}) 1.88\right.$ and 1.43); $\mathrm{CH}_{2}(2)(\delta(\mathrm{H}) 2.48$ and 2.40$)$ and the $\mathrm{CH}_{2}(1)(\delta(\mathrm{H}) 1.88$ and 1.50$)$; and the olefinic H -atom $\mathrm{H}-\mathrm{C}(12)$ and $\mathrm{CH}_{2}(11)(\delta(\mathrm{H})$ 1.98). The correlations, in the HMBC experiment, between the H -atoms with the signals at $\delta(\mathrm{H}) 3.63$ and 3.38 with the CH group at $\delta(\mathrm{C}) 48.7$, assigned to $\mathrm{C}(5)$ and bonded to H -atom with a signal at $\delta(\mathrm{H}) 1.99$, and between this latter H -atom with the O-bearing $\mathrm{CH}(\delta(\mathrm{C}) 68.5)$ localized an OH group at $\mathrm{C}(23)$. Additionally, the HMBCs between the H -atoms resonating at $\delta(\mathrm{H}) 3.63$ and 3.38 ; and $\mathrm{Me}(26)(\delta(\mathrm{H}) 0.93)$ with the $\mathrm{CO}(\delta(\mathrm{C}) 219.2)$; evidencing the $\mathrm{C}(3)=\mathrm{O}$ group and identifying the $\mathrm{Me}(23)$ group; and those between the H -atom with a signal at $\delta(\mathrm{H}) 2.22$, bonded to CH , resonating at $\delta(\mathrm{C}) 45.6$ and assigned to $\mathrm{C}(18)$, with the O-bearing CH with a signal at $\delta(\mathrm{C}) 68.3$ indicated an OH group at $\mathrm{C}(28)$. The configuration of the OH group at $\mathrm{C}(16)$ was delineated by a NOESY experiment, showing NOEs between $\mathrm{H}-\mathrm{C}(16)(\delta(\mathrm{H})$
4.28) and $\mathrm{Me}(27)(\delta(\mathrm{H}) 1.28)$ and $\mathrm{H}-\mathrm{C}(19)$, indicating a $\beta$-orientation for the OH group.

The ESI-MS of compound $\mathbf{1 0}$ showed a quasi-molecular-ion peak at $\mathrm{m} / \mathrm{z} 489.2$ $\left([M+\mathrm{H}]^{+}\right)$, suggesting the molecular formula $\mathrm{C}_{30} \mathrm{H}_{48} \mathrm{O}_{5}$ and seven degrees of unsaturation. Fragment-ion peaks at $m / z 471.3\left(\left[M-\mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}\right)$, 453.1 ([ $M-$ $\left.2 \mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}$), and a retro-Diels-Alder fragmentation-ion peak at $\mathrm{m} / \mathrm{z} 267.2$ ( $20 \%$ ) were characteristic for an olean-12-ene derivative. The IR spectrum showed absorption bands at $3350,1118,1090$, and $1045 \mathrm{~cm}^{-1}$, consistent with the presence of a OH and $\mathrm{C}-\mathrm{O}-\mathrm{C}$ groups, and a band of a CO group at $1724 \mathrm{~cm}^{-1}$. The ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectrum (Table) displayed 30 signals, which, with the DEPT experiment, revealed the presence of six Me groups ( $\delta(\mathrm{C}) 30.1,27.7,18.3,18.0,17.7$, and 16.3), an olefinic C-atom ( $\delta(\mathrm{C})$ 124.8 ), two O-bearing CH groups ( $\delta(\mathrm{C}) 74.4$ and 68.9), and two O-bearing $\mathrm{CH}_{2}$ groups $\left(\delta(\mathrm{C}) 68.4\right.$ and 68.3). The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum revealed the presence of six tertiary Me $(\delta(\mathrm{H}) 0.89,0.93,0.96,1.07,1.10$, and 1.28 ), two O-bearing CH groups (double doublets at $\delta(\mathrm{H}) 4.20$ and 3.55), two O-bearing $\mathrm{CH}_{2}$ groups (doublets at $\delta(\mathrm{H}) 3.60$ and 3.78), and it exhibited two signals obscured by the solvent $(\delta(\mathrm{H}) 3.30$ and 3.32 ), and one trisubstituted olefinic H -atom signal at $\delta(\mathrm{H}) 5.31$ attributed to $\mathrm{H}-\mathrm{C}(12)$. Analysis of COSY, NOESY, HSQC, and HMBC spectra allowed us to elucidate the structure of $16 \beta, 21 \beta, 23,28$-tetrahydroxyolean-12-en-3-one for this compound. Many of the correlations observed were similar to those of compound 9 , indicating the same substitution pattern in rings $A, B, C$, and $D$. Another OH group was assigned to $\mathrm{C}(21)$ on the basis of the HMBCs between $\operatorname{Me}(29)$ and $\operatorname{Me}(30)(\delta(\mathrm{H}) 0.96$ and 0.89 , resp.) with the $\mathrm{O}-$ bearing CH group resonating at $\delta(\mathrm{C}) 74.4$, and between $\mathrm{H}-\mathrm{C}(21)(\delta(\mathrm{H}) 3.55)$ and the C -atoms resonating at $\delta(\mathrm{C}) 48.6(\mathrm{C}(19)), 45.2(\mathrm{C}(17)), 37.7(\mathrm{C}(20)), 30.1(\mathrm{C}(29))$, and $18.0(\mathrm{C}(30))$. The configuration of the OH group at $\mathrm{C}(21)$ has been determined by a NOESY experiment, where the H -atom with a signal at $\delta(\mathrm{H}) 3.55$ showed NOE with $\mathrm{Me}(29)$ and $\mathrm{H}-\mathrm{C}(16)$ revealing a $\beta$-orientation for the OH group.

The ESI-MS of compound $\mathbf{1 1}$ exhibited a quasi-molecular-ion peak at $\mathrm{m} / \mathrm{z} 505.3$ $\left([M+H]^{+}\right)$, suggesting the molecular formula $\mathrm{C}_{30} \mathrm{H}_{48} \mathrm{O}_{6}$ and seven degrees of unsaturation. Fragment-ion peaks at $m / z 487.2\left(\left[M-\mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}\right), 469.4$ ([ $M-$ $\left.2 \mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}$), and retro-Diels-Alder fragmentation-ion peak at $m / z 283.1$ (20\%) evidenced an olean-12-ene derivative. The IR spectrum showed absorption bands at $3330,1128,1080$, and $1050 \mathrm{~cm}^{-1}$, consistent with the presence of OH and $\mathrm{HO}-\mathrm{C}$ groups, and a band of a CO group at $1723 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}$-NMR spectra were consistent with an olean-12-ene skeleton. The ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectrum (Table) displayed 30 signals, which, with the DEPT experiment, revealed the presence of six Me groups ( $\delta(\mathrm{C}) 30.6$, $28.1,19.2,18.5,17.8$, and 16.3 ), an olefinic C-atom $(\delta(\mathrm{C}) 125.6)$, three O-bearing CH groups ( $\delta(\mathrm{C}) 78.7,74.4$, and 69.8), and two O-bearing $\mathrm{CH}_{2}$ groups ( $\delta(\mathrm{C}) 69.4$ and 59.6). The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum revealed the presence of six tertiary Me $(\delta(\mathrm{H}) 1.30,1.10,1.08$, $1.00,0.93$, and 0.92 ), three O-bearing CH groups (one as double doublet at $\delta(\mathrm{H}) 4.63$ ) and two as doublets at $\delta(\mathrm{H}) 3.98$ and 3.52), two O-bearing $\mathrm{CH}_{2}$ groups (four doublets at $\delta(\mathrm{H}) 3.92,3.56$ and 3.62, 3.36), and one trisubstituted olefinic H-atom ( $\delta(\mathrm{H}) 5.40)$ assigned as $\mathrm{H}-\mathrm{C}(12)$. Analysis of COSY, NOESY, HSQC, and HMBC spectra allowed us to determine the structure of $16 \beta, 21 \beta, 22 \alpha, 23,28$-pentahydroxyolean-12-en-3-one for this compound. Many of the correlations observed were similar to those of compound 10. The other OH group was assigned to $\mathrm{C}(22)$ on the basis of COSY that showed
correlation between $\mathrm{H}-\mathrm{C}(21)$ and $\mathrm{H}-\mathrm{C}(22)(\delta(\mathrm{H}) 3.52$ and 3.98 , resp.), and the large coupling constant of 11.0 Hz indicated their 1,2-trans relation. In the HMBC spectrum, correlations between $\operatorname{Me}(30)(\delta(\mathrm{H}) 0.92)$ and $\mathrm{Me}(29)(\delta(\mathrm{H}) 1.00)$ with the O-bearing $\mathrm{H}-\mathrm{C}(21)(\delta(\mathrm{C}) 78.7)$; and between $\mathrm{H}-\mathrm{C}(21)$ and the C -atoms resonating at $\delta(\mathrm{C}) 74.4$ $(\mathrm{C}(22)), 47.5(\mathrm{C}(17)), 30.6(\mathrm{C}(29))$, and $19.2(\mathrm{C}(30))$ were observed. Furthermore, the O-bearing $\mathrm{H}-\mathrm{C}(22)$ correlated with C -atoms, resonating at $\delta(\mathrm{C}) 69.8,59.6$, and 43.3 , that were assigned to the $\mathrm{C}(16), \mathrm{C}(28)$, and $\mathrm{C}(18)$, respectively. The configuration of the OH groups was determined by a NOESY experiment, where the $\mathrm{H}-\mathrm{C}(21)$ showed NOE with $\mathrm{Me}(29)$ and $\mathrm{H}-\mathrm{C}(16)$, indicating a $\beta$-orientation for the OH group, and $\mathrm{H}-\mathrm{C}(22)$ showed NOE effects with the $\mathrm{Me}(30)$ and $\mathrm{H}-\mathrm{C}(18)$, revealing an $\alpha$ orientation for the OH group.

The ESI-MS of compound $\mathbf{1 2}$ showed a quasi-molecular-ion peak at $\mathrm{m} / \mathrm{z} 475.1$ $\left([M+\mathrm{H}]^{+}\right)$, suggesting the molecular formula $\mathrm{C}_{30} \mathrm{H}_{50} \mathrm{O}_{4}$ and six degrees of unsaturation. Fragment-ion peaks at $m / z 457.3\left(\left[M-\mathrm{H}_{2} \mathrm{O}+\mathrm{H}\right]^{+}\right)$and $439.1\left(\left[M-2 \mathrm{H}_{2} \mathrm{O}+\right.\right.$ $\mathrm{H}]^{+}$) were also observed. The ${ }^{13} \mathrm{C}$-NMR spectrum (Table) showed 30 C -atom signals, identified on the basis of a DEPT experiment as those for five Me, twelve $\mathrm{CH}_{2}$, seven CH groups, and six quaternary $\mathrm{C}-\mathrm{atoms}$. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ data, together with those derived from an HSQC experiment, evidenced the presence of two olefinic H -atoms $(\delta(\mathrm{H}) 4.72$ and 4.60$)$, bonded to the C -atom resonating at $\delta(\mathrm{C}) 111.1$, four H -atoms (two doublets at $\delta(\mathrm{H}) 4.10$ and 3.44 , correlated to the C -atom resonating at $\delta(\mathrm{C}) 62.4$, and one as doublet at $\delta(\mathrm{H}) 3.52$, and one at $\delta(\mathrm{H}) 3.29$ obscured by solvent, correlated to the C -atom resonating at $\delta(\mathrm{C}) 67.7$ ), and, finally, two H -atoms (double doublets at $\delta(\mathrm{H}) 3.73$ and 3.58), assigned to the C -atoms resonating at $\delta(\mathrm{C}) 80.0$ and 74.2, respectively. In the upfield region, five Me singlets at $\delta(\mathrm{H}) 1.69,1.11,1.03,0.90$, and 0.68 , correlated, in the HSQC, with the C-atom resonances at $\delta(\mathrm{C}) 19.9,17.7,16.8,17.5$, and 13.0 , respectively, were identified. The ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H}$-COSY experiment showed the following correlations: $\mathrm{H}-\mathrm{C}(3)(\delta(\mathrm{H}) 3.58)$ with $\mathrm{CH}_{2}(2)(\delta(\mathrm{H}) 1.66-1.60)$, which showed a cross-peak with $\mathrm{CH}_{2}(1)(\delta(\mathrm{H}) 1.68-1.63$ and $0.95-0.89) ; \mathrm{H}-\mathrm{C}(16)(\delta(\mathrm{H})$ 3.73 ) with $\mathrm{CH}_{2}(15)(\delta(\mathrm{H}) 1.82,1.45-1.40)$; and $\mathrm{H}-\mathrm{C}(19)$ (multiplet at $\left.\delta(\mathrm{H}) 2.50-2.45\right)$ with $\mathrm{H}-\mathrm{C}(18)(\delta(\mathrm{H}) 1.58-1.50)$ and $\mathrm{CH}_{2}(21)(\delta(\mathrm{H}) 2.05-2.02,1.48-1.41)$. The HMBC experiment furnished useful data to solve the structure. In fact, the $\mathrm{sp}^{2}$ - C -atom $\mathrm{C}(29)$ correlated with $\mathrm{Me}(30)(\delta(\mathrm{H}) 1.69)$ and the $\mathrm{H}-\mathrm{C}(19)(\delta(\mathrm{H}) 2.50-2.45)$. The $\mathrm{H}-$ atoms of $\mathrm{Me}(30)$ were also correlated with the C -atoms resonating at $\delta(\mathrm{C}) 151.6$ $(\mathrm{C}(20))$ and $49.6(\mathrm{C}(19))$, while $\mathrm{H}-\mathrm{C}(19)$ also displayed correlations with C -atoms, at resonating $\delta(\mathrm{C}) 46.2,33.9$, and 19.9 , assigned to $\mathrm{C}(17), \mathrm{C}(22)$, and $\mathrm{C}(30)$, respectively. Moreover $\mathrm{H}-\mathrm{C}(3)(\delta(\mathrm{H}) 3.58)$ and $\mathrm{CH}_{2}(23)(\delta(\mathrm{H}) 3.52,3.29)$, in the same HMBC experiment, gave cross-peaks with C -atoms resonating at $\delta(\mathrm{C}) 49.4,43.9$, and 13.0, assigned to $\mathrm{C}(5), \mathrm{C}(4)$, and $\mathrm{C}(24)$, respectively. Finally, $\mathrm{H}-\mathrm{C}(16)(\delta(\mathrm{H}) 3.73)$ and $\mathrm{CH}_{2}(28)(\delta(\mathrm{H}) 4.10$ and 3.44$)$ gave cross-peaks with $\mathrm{C}(22)$ and those, resonating at $\delta(C) 49.8$ and 46.2 , assigned to $\mathrm{C}(18)$ and $\mathrm{C}(17)$, respectively. These data were in accordance with a lupane triterpene structure. The relative configurations of the stereogenic C -atoms were determined by a NOESY experiment. The H -atoms of $\mathrm{Me}(27)$ showed NOE with the $\mathrm{H}-\mathrm{C}(16)$, indicating a $\beta$-configuration of the OH group. These data allowed us to determine the structure of $3 \beta, 16 \beta, 23,28$-tetrahydroxylup-20(29)-ene for this compound.

We thank the Associazione Italiana per la Promozione delle Ricerche su Ambiente e Salute umana (AIPRAS-Onlus) for financial support, and CIMCF (Centro Interdipartimentale di Metodologie Chimico-Fisiche) of University of Naples 'Federico II'.

## Experimental Part

General. Optical rotations: in MeOH or $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; Perkin-Elmer 141 polarimeter. IR Spectra: Jasco FT/IR-430 instrument. HPLC: Shimadzu LC-10AD by using a refractive-index detector Shimadzu RID10A. Semiprep. HPLC: RP-18 (LiChrospher $10 \mu \mathrm{~m}, 250 \times 10 \mathrm{~mm}$ i.d.; Merck) column with a flow rate of $1.2 \mathrm{ml} \mathrm{min}{ }^{-1}$. Column chromatography (CC): Merck Kieselgel $60\left(\mathrm{SiO}_{2} ; 230-400 \mathrm{mash}\right)$. Prep. TLC: silica gel ( $U V-254$ precoated) plates with 0.5 - and $1.0-\mathrm{mm}$ thickness (Merck). ${ }^{1} \mathrm{H}$ - and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ Spectra: Varian INOVA-500 FT NMR spectrometer ( ${ }^{1} \mathrm{H}$ at 499.710 and ${ }^{13} \mathrm{C}$ at 125.663 MHz ), in $\mathrm{CDCl}_{3}$ or $\mathrm{CD}_{3} \mathrm{OD}$ solns., at $25^{\circ}, \delta$ in ppm, $J$ in Hz . Proton-detected heteronuclear correlations were measured using a gradient heteronuclear single-quantum coherence (HSQC), optimized for ${ }^{1} J(\mathrm{H}, \mathrm{C})=140 \mathrm{~Hz}$, and a gradient heteronuclear multiple bond coherence (HMBC), optimized for ${ }^{n} J(\mathrm{H}, \mathrm{C})=8 \mathrm{~Hz}$.

Plant Material. Gymnema sylvestre was purchased from Mother Herbs Ltd. (13 Street, Madhu Vihar, Patpadganj, Delhi - 110092, India, e-mail: info@motherherbs.com) and identified by Prof. Antonino Pollio of the Dipartimento delle Scienze Biologiche of the University of Naples. A sample specimen (HERBNAWY 124) has been deposited with the herbarium of the University Federico II.

Extraction and Isolation. Dried and finely powdered aerial parts of G. sylvestre ( 7.0 kg ) were sliced and extracted with $\mathrm{H}_{2} \mathrm{O}(251$ for 24 h$)$ and successively with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (201 for 96 h ). The org. extract was filtered and evaporated in vacuo to remove $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The resulting extract ( 350 g ) was fractionated into acidic and neutral fractions with aq. 2 N NaOH soln. The neutral soln., washed with $\mathrm{H}_{2} \mathrm{O}$ and concentrated in vacuo $(175 \mathrm{~g})$, was subjected to $\mathrm{CC}\left(\mathrm{SiO}_{2}\right.$; with petroleum ether ( PE$), \mathrm{CH}_{2} \mathrm{Cl}_{2}, \mathrm{AcOEt}, \mathrm{Me}_{2} \mathrm{CO}$, MeOH , and $\mathrm{H}_{2} \mathrm{O}$ ).

The fraction eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(25.0 \mathrm{~g})$ was fractionated by $\mathrm{CC}\left(\mathrm{SiO}_{2} ; \mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 100: 0\right.$ to $0: 100$ ).

The fractions eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(592 \mathrm{mg})$ were purified by flash $\mathrm{CC}\left(\mathrm{SiO}_{2}\right.$, and then the fractions eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{AcOEt} 17: 3(37 \mathrm{mg})$ were further purified by prep. TLC $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{Me}_{2} \mathrm{CO} 17: 3\right)$ to give triterpene $\mathbf{1}(5 \mathrm{mg})$.

The fractions eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 19: 1(913 \mathrm{mg})$ were purified by $\mathrm{CC}\left(\mathrm{SiO}_{2}\right)$, and the fractions eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 19: 1(62 \mathrm{mg})$, were further purified by HPLC $(R P-18 ; \mathrm{MeOH} /$ $\left.\mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O} 2: 7: 1\right)$ to yield triterpenes $\mathbf{3}, \mathbf{4}, \mathbf{9}$, and $\mathbf{1 3}(2,2,15$, and 2 mg , resp.).

The fractions eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 9: 1(96 \mathrm{mg})$ were purified by HPLC $(R P-18 ; \mathrm{MeOH} /$ $\left.\mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O} 3: 4: 3\right)$ to yield triterpene $6(36 \mathrm{mg})$.

The fractions eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 9: 1(2.28 \mathrm{~g})$ were purified by $\mathrm{CC}\left(\mathrm{SiO}_{2}\right)$, and then fractions eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 4: 1(291 \mathrm{mg})$ were purified by $\mathrm{HPLC}\left(R P-18 ; \mathrm{MeOH} / \mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O} 2: 2: 1\right)$ to give triterpenes $\mathbf{8}$ and $\mathbf{1 2}$ ( 3 and 15 mg , resp.).

The fractions eluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH} 1: 9(6.38 \mathrm{~g})$ were purified by flash $\mathrm{CC}\left(\mathrm{SiO}_{2}\right)$, and the fractions eluted with $\mathrm{Me}_{2} \mathrm{CO}(611 \mathrm{mg})$ were purified by HPLC ( $R P-18 \mathrm{Sep}-$ Pak; $\mathrm{MeOH} / \mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O}$ $1: 2: 2)$ to give Frs. $1-6$. Fr. $4(60 \mathrm{mg})$ was purified HPLC $\left(R P-18 ; \mathrm{MeOH} / \mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O} 2: 3: 5\right)$ to give triterpene $\mathbf{1 1}(6 \mathrm{mg})$. Fr. $5(127 \mathrm{mg})$ was purified by $\mathrm{HPLC}\left(R P-18\right.$; $\left.\mathrm{MeOH} / \mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O} 2: 5: 3\right)$ to give triterpenes 2, 5, and $7(43,12$, and 10 mg , resp.). Fr. $6(25 \mathrm{mg})$ was purified by HPLC ( $R P-18$; MeOH/ $\left.\mathrm{MeCN} / \mathrm{H}_{2} \mathrm{O} 2: 5: 3\right)$ to give triterpene $\mathbf{1 0}(22 \mathrm{mg})$.
