Contents

Specialized sessions

Accounting for record linkage errors in inference (S2G-SIS) 2

Probabilistic record linkage with less than three matching variables. 3
Tiziana Tuoto and Marco Fortini

Advanced methods for measuring and communicating uncertainty in official statistics 9

A model for measuring the accuracy in spatial price statistics using scanner data. 10
Ilaria Benedetti and Federico Crescenzi

Communication of Uncertainty of Official Statistics. 16
Edwin de Jonge and Gian Luigi Mazzi

Measuring uncertainty for infra-annual macroeconomic statistics. 22
George Kapetanios, Massimiliano Marcellino and Gian Luigi Mazzi

Bayesian methods in biostatistics 27

Network Estimation of Compositional Data. 28
Nathan Osborne, Christine B. Peterson and Marina Vannucci

Using co-data to empower genomics-based prediction and variable selection. 34
Magnus M. Münch, Mirrelijn M. van Nee and Mark A. van de Wiel

Data integration versus privacy protection: a methodological challenge? 40

Statistical Disclosure Control for Integrated Data. 41
Natalie Shlomo

The Integrated System of Statistic Registers: first steps towards facing privacy issues. 47
Mauro Bruno and Roberta Radini

Trusted Smart Surveys: a possible application of Privacy Enhancing Technologies in Official Statistics. 53
Fabio Ricciato, Kostas Giannakouris, Albrecht Wirthmann and Martina Hahn

Designing adaptive clinical trials 59

Optimal designs for multi-arm exponential trials. 60
Rosamarie Frieri and Marco Novelli

Education: students' mobility and labour market 66

From measurement to explanatory approaches: an assessment of the attractiveness of the curricula programs supplied by Italian universities. 67
Isabella Sulis, Silvia Columbu and Mariano Porcu

Pull factors for university students' mobility: a gravity model approach. 73
Giovanni Boscaino and Vincenzo Giuseppe Genova

Spatial autoregressive gravity models to explain the university student mobility in Italy. 79
Silvia Bacci, Bruno Bertaccini and Chiara Bocci

Environmental Statistics (GRASPA-SIS) 85
A Time Clustering Model for Spatio-Temporal Data. 86
Clara Grazian, Gianluca Mastrantonio and Enrico Bibbona

Reconstruction of sparsely sampled functional time series using frequency domain functional principal components. 93
Amira Elayouty, Marian Scott and Claire Miller

Methods for High Dimensional Compositional Data Analysis 98
Algorithms for compositional tensors of third-order. 99
Violetta Simonacci

High-dimensional regression with compositional covariates: a robust perspective. 105
Gianna Serafina Monti and Peter Filzmoser

Three-way compositional analysis of energy intensity in manufacturing. 111
Valentin Todorov and Violetta Simonacci

Modern Statistics for Physics Discoveries 117
Identification of high-energy λ-ray sources via nonparametric clustering. 118
Giovanna Menardi, Denise Costantin, and Federico Ferraccioli

Statistical Analysis of Macroseismic Data for a better Evaluation of Earthquakes Attenuation Laws. 124
Marcello Chiodi, Antonino D'Alessandro, Giada Adelfio and Nicoletta D'Angelo

Network Modelling in Biostatistics.....130
Natural direct and indirect relative risk for mediation analysis. 131
Monia Lupparelli and Alessandra Mattei

New issues on multivariate and univariate quantile regression 137
Mixtures of quantile regressions for longitudinal data: an R package. 138
Maria Francesca Marino, Maria Giovanna Ranalli and Marco Alfò

Multivariate Mixed Hidden Markov Model for joint estimation of multiple quantiles. 144
Luca Merlo, Lea Petrella and Nikos Tzavidis

Recent methodological advances in finite mixture modeling with applications (CLADAG-SIS) 150
Aggregating Gaussian mixture components. 151
Roberto Rocci

Local and overall coefficients of determination for mixtures of generalized linear models. 157
Roberto Di Mari, Salvatore Ingrassia and Antonio Punzo

Statistical Analysis of Satellite Data (SDS-SIS) 163
Functional Data Analysis for Interferometric Syntethic Aperture Radar Data Post-Processing: The case of Santa Barbara mud volcano. 164
Matteo Fontana, Alessandra Menafoglio, Francesca Cigna and Deodato Tapete

Recent Contributions to the Understanding of the Uncertainty in Upper-Air Reference Measurements. 170
Alessandro Fassò

Statistical models and methods for Business and Industry 176
Modelling and monitoring of complex 3D shapes: a novel approach for lattice structures. 177
Bianca Maria Colosimo, Marco Grasso and Federica Garghetti

Open data powered territorial planning - Case study: The Turin historical center. 183
Silvia Casagrande, Gianmaria Origgi, Alberto Pasanisi, Martina Tamburini, Pascal Terrien, Tania Cerquitelli and Alfonso Capozzoli

Process optimization in Industry 4.0: Are all data analytics models useful? 189
Alberto Ferrer

Technology and demographic behaviours (AISP-SIS) 195
Internet and the Timing of Births. 196
Maria Sironi, Osea Giuntella and Francesco C. Billari

The Internetization of Marriage: Effects of the Diffusion of High-Speed Internet on Marriage, Divorce, and Assortative Mating. 202
Francesco C. Billari, Osea Giuntella and Luca Stella

Solicited Sessions

Advanced Statistical Methods in Health Analytics 209
Assessing the impact of the intermediate event in a non-markovian illness-death model. 210
Davide Paolo Bernasconi, Elena Tassistro, Maria Grazia Valsecchi and Laura Antolini

Big data and AI: challenges and opportunities in healthcare. 216
Vieri Emiliani, Gian Luca Cattani and Fabrizio Selmi

Statistical methodology for volume-outcome studies. 222
Marta Fiocco and Floor van Oudenhoven

Advances in textual data mining 228
Distance measures for exploring pairs of novels in a large corpus of Italian literature. 229
Matilde Trevisani and Arjuna Tuzzi

Supervised vs Unsupervised Latent Dirichlet Allocation: topic detection in lyrics. 235
Mariangela Sciandra, Alessandro Albano and Irene Carola Spera

Advances in the interaction between artificial intelligence and official statistics 241
Automated Land Cover Maps from Satellite Imagery by Deep Learning. 242
Fabrizio De Fausti, Francesco Pugliese and Diego Zardetto

CROWD4SDG: Crowdsourcing for sustainable developments goals. 248
Barbara Pernici

Permanent Population Census: evaluation of the effects of regional strategies on the process efficiency. The direct experience of Tuscany. 253
Linda Porciani, Luisa Francovich, Luca Faustini and Alessandro Valentini

Capture-recapture methods 259
Bayesian Model Averaging for Latent Class Models in Capture-Recapture. 260
Davide Di Cecco

Combining “signs of life” and survey data through latent class models to consider over-coverage in Capture-Recapture estimates of population counts. 266
Marco Fortini, Antonella Bernardini, Marco Caputi and Nicoletta Cibella

Population size estimation with interval censored counts and external information. 272
Alessio Farcomeni

Changes in environment extremes and their impacts 278
FPCA Clustering of rainfall events. 279
Gianluca Sottile, Antonio Francipane, Leonardo Noto and Giada Adelfio

Trends in rainfall extremes in the Venice lagoon catchment. 285
Ilaria Prosdocimi and Carlo Gaetan

Copulas: models and inference 291
Analysis of district heating demand through different copula-based approaches. 292
F. Marta L. Di Lascio and Andrea Menapace

CoVaR and backtesting: a comparison between a copula approach and parametric models. 298
Michele Leonardo Bianchi, Giovanni De Luca and Giorgia Rivieccio

Estimating Asymmetric Dependence via Empirical Checkerboard Copulas. 304
Wolfgang Trutschnig and Florian Griessenberger

Strong Convergence of Multivariate Maxima. 310
Michael Falk, Simone A. Padoan and Stefano Rizzelli

Data Science: when different expertise meet 316
Bayesian stochastic modelling of the temporal evolution of seismicity. 317
Elisa Varini and Renata Rotondi

Cluster Analysis for the Characterization of Residential Personal Exposure to ELF Magnetic Field. 323
Gabriella Tognola, Silvia Gallucci, Marta Bonato, Emma Chiaramello, Isabelle Magne, Martine Souques, Serena Fiocchi, Marta Parazzini and Paolo Ravazzani

Statistical Assessment and Validation of Ship Response in High Sea State by Computational Fluid Dynamics. 328
Andrea Serani, Matteo Diez and Frederick Stern

Uncertainty Quantification for PDEs with random data using the Multi-Index Stochastic Collocation method. 334
Lorenzo Tamellini and Joakim Beck

Emerging challenges in official statistics: new data sources and methods 340
Small area poverty indicators adjusted using local spatial price indices. 341
Stefano Marchetti, Luigi Biggeri, Caterina Giusti and Monica Pratesi

Smart solutions for trusted smart statistics: the European big data hackathon experience. 347
Francesco Amato, Mauro Bruno, Tania Cappadozzi, Fabrizio De Fausti and Manuela Michelini

The ESSnet Project Smart Surveys: new data sources and tools for Surveys of Official Statistics 353

Factorial and dimensional reduction methods for the construction of indicators for evaluation (SVQS-SIS) 359
A comparison of MBC with CLV and PCovR methods for dimensional reduction of the soccer players' performance attributes. 360
Maurizio Carpita, Enrico Ciavolino and Paola Pasca

A framework of cumulated chi-squared type statistics for ordered correspondence analysis. New tools and properties. 366
Antonello D'Ambra, Pietro Amenta and Luigi D'Ambra

Exploring drug consumption via an ultrametric correlation matrix. 372
Giorgia Zaccaria and Maurizio Vichi

Ranking extraction in ordinal multi-indicator systems. 378
Marco Fattore and Alberto Arcagni

Gender statistics 384
Gender differences in Italian STEM degree courses: a discrete-time competing-risks model. 385
Marco Enea and Massimo Attanasio

Some Challenges and Results in Measuring Gender Inequality. 391
Fabio Crescenzi and Francesco Di Pede

How Deep is Your Plot? Young SIS and deep statistical learning (ySIS)..397
A modal approach for clustering matrices. 398
Federico Ferraccioli and Giovanna Menardi

A Note on Detection of Perturbations in Biological Networks. 404
Vera Djordjilović

Bayesian inference for DAG-probit models. 410
Federico Castelletti

Variational Bayes for Gaussian Factor Models under the Cumulative Shrinkage Process. 416
Sirio Legramanti

Measuring poverty and vulnerability 421
Choosing the vulnerability threshold using the ROC curve. 422
Chiara Gigliarano and Conchita D'Ambrosio

New advances in applications, a Bayesian nonparametric perspective 428
Bayesian Mixture Models for Latent Class Analysis. 429
Raffaele Argiento, Bruno Bodin and Maria De Iorio

Non-Parametric Inference and Forecasting of Functional and Object Data 435
An interpretable estimator for the function-on-function linear regression model with application to the Canadian weather data. 436
Fabio Centofanti and Matteo Fontana

Statistical process monitoring of multivariate profiles from ship operating conditions. 440
Christian Capezza

Prior choice in Bayesian Modelling (SISbayes) 446
Bayesian Learning of Multiple Essential Graphs. 447
Luca La Rocca, Federico Castelletti, Stefano Peluso, Francesco Claudio Stingo and Guido Consonni

Bayesian post-processing of Gibbs sampling output for variable selection. 453
Stefano Cabras

Priors on precision parameters of IGRMF models. 459
Aldo Gardini, Fedele Greco and Carlo Trivisano

Sequence Analysis: methods and applications 465
Internal migration, family formation and social stratification in Europe. A life course approach. 466
Roberto Impicciatore, Gabriele Ballarino and Nazareno Panichella

Socio economic integration of migrants 472
A study on the characteristics of spouses who intermarry in Italy. 473
Agnese Vitali and Romina Fraboni

Statistical Analysis for mobility and transportation 479
A multilevel Analysis of University attractiveness in the network flows from Bachelor to Master's degree. 480
Silvia Columbu and Ilaria Primerano

Analysis of mobility data through a novel Cheng and Church algorithm for functional data. 486
Marta Galvani, Agostino Torti and Alessandra Menafoglio

Bridge closures in a transportation network: analysis of the impacts in the region of Lombardy. 491
Agostino Torti, Marika Arena, Giovanni Azzone, and Piercesare Secchi

Statistical Methods and Applications in Social Network Analysis 496
A clustering procedure for ego-networks data: an application to Italian elders living in couple. 497
Elvira Pelle and Roberta Pappadà

Analysing the mediating role of a network: a Bayesian latent space approach. 503
Chiara Di Maria, Antonino Abbruzzo and Gianfranco Lovison

Network-time autoregressive models for valued network panel. 509
Viviana Amati

University student mobility flows and network data structures. 515
Maria Prosperina Vitale, Giuseppe Giordano and Giancarlo Ragozini

Statistical Methods in Psychometrics 521
A simple probabilistic model to evaluate questionable interim analysis strategies. 522
Francesca Freuli and Luigi Lombardi

Incorporating Expert Knowledge in Structural Equation Models: Applications in Psychological Research. 528
Gianmarco Altoè, Claudio Zandonella Callegher, Enrico Toffalini and Massimiliano Pastore

Predicting social media addiction from Instagram profiles: A data mining approach. 534
Antonio Calcagnì, Veronica Cortellazzo, Francesca Guizzo, Paolo Girardi, Natale Canale

Structural entropy based modeling for psychological measurement. 540
Enrico Ciavolino, Mario Angelelli, Paola Pasca and Omar Carlo Gioacchino Gelo

Statistical modelling in environmental epidemiology 546
A Time Varying Coefficient Model to Estimate the Short-Term Effects of Air Pollution on Human Health. 547
Pasquale Valentini, Luigi Ippoliti and Clara Grazian

Joint Analysis of Short and Long-Term Effects of Air Pollution. 551
Annibale Biggeri, Dolores Catelan, Giorgia Stoppa and Corrado Lagazio

Statistical Modelling of Scientific Evidence for Forensic Investigation and Interpretation 557
DNA mixtures with related contributors. 558
Peter J. Green and Julia Mortera

Forensic Statistics: How to estimate life expectancy after injury. 564
Jane L. Hutton

The additional contribution of combining genetic evidence from multiple samples in a complex case. 570
Giampietro Lago

The history of forensic inference and statistics: a thematic perspective. 576
Franco Taroni and Colin Aitken

Topological learning: interpretable representations of complex data.....581
Comparing Neural Networks via Generalized Persistence. 582
Mattia G. Bergomi and Pietro Vertechi

On the topological complexity of decision boundaries. 588
António Leitão and Giovanni Petri

Persistence-based Kernels for Data Classification. 594
Ulderico Fugacci

Topological and Mixed-type learning of Brain Activity. 600
Tullia Padellini, Pierpaolo Brutti, Riccardo Giubilei

Contributed papers and Posters

Bayesian Statistics 607

A Bayesian approach for modelling dependence among mixture densities. 608
Mario Beraha, Matteo Pegoraro, Riccardo Peli and Alessandra Guglielmi

A change of glasses strategy to solve the rare type match problem. 614
Giulia Cereda and Fabio Corradi

A new prior distribution on the simplex: the extended flexible Dirichlet. 620
Roberto Ascari, Sonia Migliorati and Andrea Ongaro

ABC model choice via mixture weight estimation. 626
Gianmarco Caruso, Luca Tardella and Christian P. Robert

An ABC algorithm for random partitions arising from the Dirichlet process. 632
Mario Beraha and Riccardo Corradin

Bayesian Inference of Undirected Graphical Models from Count Data. 638
Pier Giovanni Bissiri, Monica Chiogna and Nguyen Thi Kim Hue

Bayesian IRT models in NIMBLE. 644
Sally Paganin, Chris Paciorek and Perry de Valpine

Bayesian modelling of Facebook communities via latent factor models. 650
Emanuele Aliverti

Bayesian nonparametric adaptive classification with robust prior information. 655
Francesco Denti, Andrea Cappozzo and Francesca Greselin

Choosing the right tool for the job: a systematic analysis of general purpose MCMC software. 661
Mario Beraha, Giulia Gualtieri, Eugenia Villa, Riccardo Vitali and Alessandra Guglielmi

Empirical Bayes estimation for mixture models. 667
Catia Scricciolo

Improving ABC via Large Deviations Theory. 673
Cecilia Viscardi, Michele Boreale and Fabio Corradi

Learning Bayesian Networks for Nonparanormal Data. 679
Flaminia Musella and Vincenzina Vitale

Measuring well-being combining different data sources: a Bayesian networks approach. 685
Federica Cugnata, Silvia Salini and Elena Siletti

Penalising the complexity of extensions of the Gaussian distribution. 691
Diego Battagliese and Brunero Liseo

Predictive discrepancy of credible intervals for the parameter of the Rayleigh distribution. 697
Fulvio De Santis and Stefania Gubbiotti

Small-area statistical estimation of claim risk. 702
Francesca Fortunato, Fedele Greco and Pierpaolo Cristaudo

Subject-specific Bayesian Hierarchical model for compositional data analysis. 708
Matteo Pedone and Francesco C. Stingo

Wasserstein consensus for Bayesian sample size determination. 714
Michele Cianfriglia, Tullia Padellini and Pierpaolo Brutti

Biostatistics 720

A comparison of the CAR and DAGAR spatial random effects models with an application to diabetics rate estimation in Belgium. 721
Vittoria La Serra, Christel Faes, Niel Hens and Pierpaolo Brutti

A functional approach to study the relationship between dynamic covariates and survival outcomes: an application to a randomized clinical trial on osteosarcoma. 727
Marta Spreafico, Francesca Ieva and Marta Fiocco

A Statistical Approach to the Alignment of fMRI Data. 733
Angela Andreella, Ma Feilong, Yaroslav Halchenko, James Haxby and Livio Finos

Adaptive clinical trials: Bayesian decision-theoretic and frequentist approaches for cost-effectiveness analysis. 739
Martin Forster and Marco Novelli

Bootstrap corrected Propensity Score: Application for Anticoagulant Therapy in Haemodialysis Patients. 745
Maeregu W. Arisido, Fulvia Mecatti and Paola Rebora

Combining multiple sources to overcome misclassification bias in epidemiological database studies. 751
Francesca Beraldi, Rosa Gini, Emanuela Dreassi, Leonardo Grilli and Carla Rampichini

Deep Sparse Autoencoder-based Feature Selection for SNPs Validation in Prostate Cancer Radiogenomics. 756
Michela Carlotta Massi, Francesca Ieva, Anna Maria Paganoni, Andrea Manzoni, Paolo Zunino, Nicola Rares Franco, Tiziana Rancati and Catharine West

Graphical models for count data: an application to single-cell RNA sequencing. 762
Nguyen Thi Kim Hue, Monica Chiogna and Davide Risso

Interregional mobility, socio-economic inequality and mortality among cancer patients. 768
Claudio Rubino, Mauro Ferrante, Antonino Abbruzzo, Giovanna Fantaci and Salvatore Scondotto

PET radiomics-based lesions representation in Hodgkin lymphoma patients. 774
Lara Cavinato, Martina Sollini, Margarita Kirienko, Matteo Biroli, Francesca Ricci, Letizia Calderoni, Elena Tabacchi, Cristina Nanni, Pier Luigi Zinzani, Stefano Fanti, Anna Guidetti, Alessandra Alessi, Paolo Corradini, Ettore Seregni, Carmelo Carlo-Stella, Arturo Chiti and Francesca Ieva

Prediction of late radiotherapy toxicity in prostate cancer patients via joint analysis of SNPs sequences. 780
Nicola Rares Franco, Michela Carlotta Massi, Francesca Ieva, Anna Maria Paganoni, Andrea Manzoni, Paolo Zunino, Tiziana Rancati and Catharine West

Predictive versus posterior probabilities for phase II trial monitoring. 785
Valeria Sambucini

Profile networks for precision medicine. 791
Andrea Lazzerini, Monia Lupparelli and Francesco C. Stingo

Proton-Pump Inhibitor Provider Profiling via Funnel Plots and Poisson Regression. 797
Dario Delle Vedove, Francesca Ieva and Anna Maria Paganoni

Selecting optimal thresholds in ROC analysis with clustered data. 803
Duc Khanh To, Gianfranco Adimari and Monica Chiogna

Environment, Physics and Engineering 809

A hidden semi-Markov model for segmenting environmental toroidal data. 810
Francesco Lagona and Antonello Maruotti

An experimental analysis on quality and security about green communication. 816
Vito Santarcangelo, Emilio Massa, Davide Scintu, Michele Di Lecce and Massimiliano Giacalone

An improved sensitivity-data based method for probabilistic ecological risk assessment. 822
Sonia Migliorati and Gianna Serafina Monti

Comparing predictive distributions in EMOS. 828
Giummolè Federica and Mameli Valentina

Compositional analysis of fish communities in a fast changing marine ecosystem. 834
Pierfrancesco Alaimo Di Loro, Marco Mingione, Giovanna Jona Lasinio, Sara Martino and Francesco Colloca

FDA dimension reduction techniques and components separation in Fourier-transform infrared spectroscopy. 840
Francesca Di Salvo, Elena Piacenza and Delia Francesca Chillura Martino

Functional Data Analysis for Spectroscopy Data. 846
Mara S. Bernardi, Matteo Fontana, Alessandra Menafoglio, Diego Perugini, Alessandro Pisello, Marco Ferrari, Simone De Angelis, Maria Cristina De Sanctis and Simone Vantini

Functional graphical model for spectrometric data analysis. 852
Laura Codazzi, Alessandro Colombi, Matteo Gianella, Raffaele Argiento, Lucia Paci and Alessia Pini

Local LGCP estimation for spatial seismic processes. 857
Nicoletta D'Angelo, Marianna Siino, Antonino D'Alessandro and Giada Adelfio

Observation-driven models for storm counts. 863
Mirko Armillotta, Alessandra Luati and Monia Lupparelli

Statistical control of complex geometries, with application to Additive Manufacturing. 869
Riccardo Scimone, Tommaso Taormina, Bianca Maria Colosimo, Marco Grasso, Alessandra Menafoglio, Piercesare Secchi

Tree attributes map by 3P sampling in a design-based framework. 875
Lorenzo Fattorini and Sara Franceschi

Unsupervised classification of texture images by gray-level spatial dependence matrices and genetic algorithms. 880
Roberto Baragona and Laura Bocci

Finance, business and official statistics 886

A discrete choice approach to analyze contractual attributes in the durum wheat sector in Italy. 887
Stefano Ciliberti, Simone Del Sarto, Giulia Pastorelli, Angelo Frascarelli and Gaetano Martino

A fuzzy approach to the measurement of the employment rate. 893
Bruno Cheli, Alessandra Coli and Andrea Regoli

A proposal to model credit risk contagion using network count-based models. 898
Arianna Agosto and Daniel Felix Ahelegbey

A similarity matrix approach to empower ESCO interfaces for testing, debugging and in support of users' experience. 904
Adham Kahlawi, Cristina Martelli, Lucia Buzzigoli, Laura Grassini

Adding MIDAS terms to Linear ARCH models in a Quantile Regression framework. 910
Vincenzo Candila and Lea Petrella

Company requirements in Italian tourism sector: an analysis for profiles. 916
Paolo Mariani, Andrea Marletta, Lucio Masserini and Mariangela Zenga

Determinants of Firms' Default Risk after the 2008 and 2011 Economic Crises: a Latent Growth Models Approach. 921
Lucio Masserini, Matilde Bini and Alessandro Zeli

Double Asymmetric GARCH-MIDAS model - new insights and results. 927
Alessandra Amendola, Vincenzo Candila and Giampiero M. Gallo

European SMEs and Circular Economy Activities: Evaluating the Advantage on Firm Performance through the Estimation of Average Treatment Effects. 933
Luca Secondi

Financial Spillover Measures to Assess the Stability of Basket-based Stablecoins. 939
Paolo Pagnottoni

Forecasting Banknote Flows in BdI Branches: Speed-up with Machine Learning. 945
Marco Brandi, Monica Fusaro, Tiziana Laureti and Giorgia Rocco

Fully reconciled GDP forecasts from Income and Expenditure sides. 951
Luisa Bisaglia, Tommaso Di Fonzo and Daniele Girolimetto

GLASSO Estimation of Commodity Risks. 957
Beatrice Foroni, Saverio Mazza, Giacomo Morelli and Lea Petrella

Measuring the Effect of Unconventional Policies on Stock Market Volatility. 963
Giampiero M. Gallo, Demetrio Lacava and Edoardo Otranto

Multidimensional versus unidimensional poverty measurement. 969
Michele Costa

Multiple outcome analysis of European Agriculture in 2000-2016: a latent class multivariate trajectory approach. 975
Alessandro Magrini

Nowcasting GDP using mixed-frequency based composite confidence indicators. 981
Maria Carannante, Raffaele Mattera, Michelangelo Misuraca, Germana Scepi and Maria Spano

On the tangible and intangible assets of Initial Coin Offerings. 987
Paola Cerchiello and Anca Mirela Toma

Seasonality variation of electricity demand: decompositions and tests. 993
Luigi Grossi and Mauro Mussini

SMEs circular economy practices in the European Union: Implications for sustainability. 999
Nunzio Tritto, Josè G. Dias and Francesca Bassi

Tax Incentives' Effect on the Provision of Occupational Welfare in Italian Enterprises. 1005
Alessandra Righi

The determinants of eco-innovation: a country comparison using the community innovation survey. 1011
Ida D'Attoma and Silvia Pacei

World ranking of urban sustainability through composite indicators. 1017
Elena Grimaccia, Alessia Naccarato and Silvia Terzi

Machine Learning and Data Science.....1023

A novel approach for Artificial Intelligence through Lorenz zonoids and Shapley Values. 1024
Paolo Giudici and Emanuela Raffinetti

A warning signal for variable importance interpretation in tree-based algorithms. 1030
Anna Gottard and Giulia Vannucci

Assessment of the effectiveness of digital flyers: analysis of viewing behavior using eye tracking. 1036
Gianpaolo Zammarchi, Claudio Conversano and Francesco Mola

At risk mental status analysis: a comparison of model selection methods for ordinal target variable. 1042
Elena Ballante, Silvia Molteni, Martina Mensi and Silvia Figini

Categorical Encoding for Machine Learning. 1048
Agostino Di Ciaccio

Dynamic Quantile Regression Forest. 1054
Mila Andreani and Lea Petrella

Estimating the UK Sentiment Using Twitter. 1059
Stephan Schlosser, Daniele Toninelli and Michela Cameletti

Forecasting local rice prices from crowdsourced data in Nigeria. 1065
Ilaria Lucrezia Amerise and Gloria Solano Hermosilla

Generalized Mixed Effects Random Forest: does Machine Learning help in predicting university student dropout? 1071
Massimo Pellagatti, Chiara Masci, Francesca Ieva and Anna Maria Paganoni

HateViz: a textual dashboard Twitter data-driven. 1077
Emma Zavarrone, Maria Gabriella Grassia, Marina Marino, Rocco Mazza and Nicola Canestrari

How to perform cyber risk assessment via cumulative logit models. 1083
Silvia Facchinetti, Silvia Angela Osmetti and Claudia Tarantola

Machine learning prediction for accounting system. 1087
Chiara Bardelli and Silvia Figini

Teaching statistics: an assessment framework based on Multidimensional IRT and Knowledge Space Theory. 1093
Cristina Davino, Rosa Fabbricatore, Carla Galluccio, Daniela Pacella, Domenico Vistocco, Francesco Palumbo

The weight of words: textual data versus sentiment analysis in stock returns prediction. 1099
Riccardo Ferretti and Andrea Sciandra

Unsupervised Energy Trees: clustering with complex and mixed-type variables. 1105
Riccardo Giubilei, Tullia Padellini and Pierpaolo Brutti

Using anchoring vignettes to adjust self-reported life satisfaction: a nonparametric approach leading to a Semantic Differential scale. 1111
Sara Garbin, Serena Berretta, Maria Iannario and Omar Paccagnella

Variable selection for robust model-based learning from contaminated data. 1117
Andrea Cappozzo, Francesca Greselin and Thomas Brendan Murphy

Variable Selection in Text Regressions: Back to Lasso? 1123
Marzia Freo and Alessandra Luati

Web Usage Mining and Website Effectiveness. 1129
Maria Francesca Cracolici and Furio Urso

Models and methods - Categorical, Ordinal, Rank Data 1135

Aberration for the analysis of two-way contingency tables. 1136
Roberto Fontana and Fabio Rapallo

An investigation of the paradoxical behaviour of **κ**-type inter-rater agreement coefficients for nominal data. 1142
Amalia Vanacore and Maria Sole Pellegrino

Analyzing faking-good response data: Combination of a Replacement and a Binomial (CRB) distribution approach. 1148
Luigi Lombardi and Antonio Calcagnì

BOD – min range: A Robustness Analysis Method for Composite Indicators. 1154
Emiliano Seri, Leonardo Salvatore Alaimo and Vittoria Carolina Malpassuti

Comparing classifiers for ordinal variables. 1160
Silvia Golia and Maurizio Carpita

Discovering Interaction Effects Between Subject-Specific Covariates: A New Probabilistic Approach For Preference Data. 1166
Alessio Baldassarre, Claudio Conversano, Antonio D'Ambrosio, Mark De Rooij and Elise Dusseldorp

Hybrid random forests for ordinal data. 1171
Rosaria Simone and Gerhard Tutz

Model-based approach to biclustering ordinal data. 1177
Monia Ranalli and Francesca Martella

New algorithms and goodness-of-fit diagnostics for ranked data modelling with the Extended Plackett-Luce distribution. 1183
Cristina Mollica and Luca Tardella

Non-metric unfolding on augmented data matrix: a copula-based approach. 1189
Marta Nai Ruscone and Antonio D'Ambrosio

Ordinal probability effect measures for dyadic analysis in cumulative models. 1194
Maria Iannario and Domenico Vistocco

Simulated annealing for maximum rater agreement. 1200
Fabio Rapallo and Maria Piera Rogantin

Models and methods – Regression.....1206

A Clusterwise regression method for Distributional-valued Data. 1207
Rosanna Verde, Francisco de A. T. de Carvalho and Antonio Balzanella

A nonparametric approach for nonlinear variable screening in high-dimensions. 1213
Francesco Giordano, Sara Milito and Lucia Maria Parrella

Adjusted scores for inference in negative binomial regression. 1219
Euloge C. Kenne Pagui, Alessandra Salvan and Nicola Sartori

Estimation of the treatment effect variance in a difference-in-differences framework. 1224
Marco Doretti and Giorgio E. Montanari

Exploring multicollinearity in quantile regression. 1230
Cristina Davino, Tormod Naes, Rosaria Romano and Domenico Vistocco

Generalized M-quantile random effects model. 1236
Francesco Schirripa Spagnolo and Vincenzo Mauro

Goodness-of-fit assessment in linear quantile regression. 1242
Ilaria Lucrezia Amerise and Agostino Tarsitano

Joint Redundancy Analysis by a multivariate linear predictor. 1248
Laura Marcis and Renato Salvatore

M-quantile regression shrinkage and selection via the lasso. 1254
M. Giovanna Ranalli, Lea Petrella and Francesco Pantalone

New insights into the Conditioning and Gain Score approaches in multilevel analysis. 1260
Bruno Arpino, Silvia Bacci, Leonardo Grilli, Raffaele Guetto and Carla Rampichini

Simultaneous confidence regions and curvature measures in nonlinear models. 1265
Claudia Furlan and Cinzia Mortarino

Models and methods – Sampling 1271

Design-based consistency of the Horvitz-Thompson estimator for spatial populations. 1272
Lorenzo Fattorini, Marzia Marcheselli, Caterina Pisani and Luca Pratelli

Empirical likelihood in the statistical matching for informative samples. 1278
Daniela Marella and Danny Pfeffermann

Evaluating a Hybrid One-Staged Snowball Sampling through Bootstrap Method on a Simulated Population. 1284
Venera Tomaselli and Giulio Giacomo Cantone

How optimal subsampling depends on guessed parameter values. 1290
Laura Deldossi and Chiara Tommasi

Indicators for risk of selection bias in non-probability samples. 1296
Emilia Rocco and Alessandra Petrucci

On the behaviour of the maximum likelihood estimator for exponential models under a fixed and a two-stage design. 1302
Caterina May and Chiara Tommasi

Pseudo-population based resamplings for two-stage design. 1308
Pier Luigi Conti, Daniela Marella and Vincenzina Vitale

Models and methods - Theoretical Issues in Statistical Inference 1314

A new mixture model for three-way data. 1315
Salvatore D. Tomarchio, Antonio Punzo and Luca Bagnato

A Sequential Test for the Cpmk Index. 1320
Michele Scagliarini

Probability Interpretations and the Selection of the Most Effective Statistics Method. 1326
Paolo Rocchi

Robust Composite Inference. 1332
Valentina Mameli, Monica Musio, Erlis Ruli and Laura Ventura

Statistical hypothesis testing within the Generalized Error Distribution: Comparing the behavior of some nonparametric techniques. 1338
Massimiliano Giacalone and Demetrio Panarello

Stochastic dependence with discrete copulas. 1344
Fabrizio Durante and Elisa Perrone

Educational integration of foreign citizen children in Italy: a synthetic indicator

Un indicatore sintetico dell'integrazione scolastica degli studenti con cittadinanza straniera

Alessio Buonomo, Stefania Capecchi and Rosaria Simone

Abstract Social inclusion and integration are prominent topics in social sciences, and specifically in the educational field, in order to contrast the experience of inequality conditions at school. Using data from the 2015 national survey on "Integration of the second generation", the paper proposes a synthetic indicator of educational integration of second-generation children in Italy. The chosen methodology is suitable to model subjective assessments on rating scales while accounting for both agreement and heterogeneity in response patterns.

Abstract *L'inclusione sociale e l'integrazione rappresentano temi cruciali nelle scienze sociali ed assumono rilievo specifico nell'ambito dell'istruzione. Utilizzando i dati dell'Indagine Istat sull'integrazione delle seconde generazioni (ISG 2015), lo studio propone un indicatore sintetico di integrazione scolastica che considera sia la percezione del tratto in esame che l'eterogeneitá delle risposte.*

Key words: Model-based indicators, Educational integration, Second-generation, Foreign children, Rating data

1 Introduction

The issue of migrants' integration is a key topic in social sciences, and it is particularly relevant in the educational field to counteract the experience of inequality conditions by children with a migratory background, especially of those born abroad. Focusing on Italy, the number of foreigners has rapidly increased in the last two

decades from about 350,000 residents in the early nineties to over 5 million, according to the Population Registers. The consequent growing number of their children have attracted the interest of scholars [10].

Due to the fact that the increase of the second generations in Italy is a relatively recent phenomenon, the school environment is a particularly important field of study [3]. Educational and social integration can boost placement into community and labour market [1], especially in the case of immigrants, and thus be beneficial to the whole society. Indeed, studies that focus on immigrant-specific educational inequalities have proven that social and scholastic integration are fundamental in determining educational success [8, 4].

Considering the CI-CUB procedure proposed by Capecchi and Simone [2], the paper aims at introducing an indicator of integration at school for both Italian and second-generation foreign children, distinguishing by nationality. The study provides a synthetic measure able to summarize subjective evaluations expressed by a large number of respondents, relying on CUB models framework [9].

After a brief introduction to the available data, the implemented methodology is illustrated, some results are discussed and further developments of the research are outlined.

2 Data and methods

The "Integration of the second generation" survey (ISG) has been conducted in Italy by the Italian National Statistical Institute [5] in 2015 and offers information on students of secondary schools in Italy. The overall unweighted sample amounted to $68,127$ individuals, of which 52% were students in upper secondary school. In order to deal with a more homogeneous subset, our analyses focus on opinions of students attending higher secondary state schools. Thus, the final target sample consists of $35,427$ unweighted individuals.

We investigate students' assessment - in terms of agreement - to 20 items referred to their perceived conditions/habits gathered in four different batteries: (A) relationships with classmates; (B) homework and study habits; (C) relationships with teachers; (D) family attitudes towards school importance. Variables of interest are comprised in question 14, in section *C* of the questionnaire. Each battery is composed by 5 items, whose responses are expressed on a 5 point Likert scale (1="strongly agree", 5="strongly disagree"). For interpretative purposes, the variables were reversed (with the exception of items A_3, B_3, B_5 and D_4) and organized in order to have the same direction, from the lowest to the highest agreement.

In the target sample, male students are about 50%; 15% of respondents are under the age of 15, and 58% are aged 15-17, whereas 27% are over 17. Italian interviewees represent 53% of the sample. Among foreigners, the three more frequent nationalities are Romanian, Albanian and Moroccan (10%, 7% and 4%, respectively). Foreign children born in Italy (second generation) are 9% of the sample, whereas those born abroad are 38%. Since foreign students represent a heterogeneous group

due to different origins and characteristics, a synthetic measure of their perception of integration may be useful both for research and policy purposes.

In order to illustrate multifaceted and sometimes elusive constructs, as in the case of subjective evaluations and perceptions, the number of composite indicators is growing. In fact, to general readership it may be easier to comprehend a single synthetic measure rather than inspect results from different separate indicators [7].

When dealing with ordinal data, CUB models allow to consider the uncertainty component in response behaviour, usually neglected in standard approaches. In this respect, Capecchi and Simone [2] recently proposed the novel CI-CUB - Composite Indicator CUB - to compute a model-based indicator within the CUB framework [9].

In its simplest version, a CUB model (acronym of Combination of Uniform and shifted Binomial) is implemented on ratings R to single questions to provide a global measure of individual assessment. CUB models are specified via a two component mixture of discrete distributions, one designated to measure the *feeling* towards the item (Binomial), and the other accounting for the inherent *uncertainty* (Uniform).

Then, a CUB model assumes that, for a given number of categories m, the random variable R is specified by the probability mass distribution:

$$Pr(R = r \mid \boldsymbol{\theta}) = \pi \binom{m-1}{r-1} \xi^{m-r} (1-\xi)^{r-1} + (1-\pi)\frac{1}{m},\ r = 1,2,\ldots,m.$$

The parameter $(1-\xi)$ of the Binomial and the weight of the uncertainty in the mixture $(1-\pi)$ provide a description of both perception towards the item (which can be indicated as "agreement" with given statements on perceived integration in the present case study), and heterogeneity of the response distribution. Since the two featuring parameters are normalized measures ranging in (0;1], different items and groups can be displayed and compared at a glance in the unit square. Therefore, CUB models establish a different paradigm, providing a unifying tool to interpret and compare the responses given to a number of items, even if measured on scales with different lengths, in a parsimonious way. The possibility of assessing the veracity of the rating evaluations with respect to the analyzed items/dimensions by means of easy-to-interpret graphical outputs is indeed one of the strengths of CUB framework. A comprehensive R library is devoted to CUB model fitting on the official CRAN repository.

In this setting, CI-CUB indicators provide a synthesis of CUB models applied to K items by n respondents: the random variable R_k associated to the *k-th* item follows $R_k \sim \text{CUB}\ (\hat{\pi}_k, \hat{\xi}_k)$, for $k = 1,\ldots,K$. Then, the CI-CUB indicator is a weighted CUB model $\tilde{R} \sim \text{CUB}\ (\tilde{\pi}, \tilde{\xi})$ where

$$\tilde{\pi} = \sum_{k=1}^{K} w_k \hat{\pi}_k, \qquad \tilde{\xi} = \sum_{k=1}^{K} w_k \hat{\xi}_k, \tag{1}$$

with $(\hat{\pi}_k, \hat{\xi}_k)$, for $k = 1,\ldots,K$ being the estimated parameters for the K variables of interest.

A CI-CUB can be seen as a two-dimensional composite indicator for the latent trait under investigation such as, in this case study, the perceived educational integration as measured through the 4 batteries of items (A, B, C, D).

The choice of the weights' system w_k is usually driven by specific circumstances and available information. In the present study, due to the underlying structure of the data along the 4 dimensions, we select the weights expressed by the (normalized) squared factor loadings of the 4 categorical principal components computed on the selected variables.

3 Results

While additive data-driven approaches may lead to neglect an inherent uncertainty component when present, CUB models separately estimated for each of the 20 items of question 14 (here not reported for space constraints) show a medium-high level of agreement, with the uncertainty being substantially not negligible for most of the items. More specifically, item C_1, referred to the perception of an equal treatment received by teachers, shows the highest level of uncertainty with a substantive agreement; on the other hand, item D_4 gets the highest level of agreement with a low uncertainty, meaning that family members do consider studying to be a prominent aspect of life success.

Analysing the whole dataset, the advantages of the implemented CI-CUB indicators are highlighted. In order to provide synthetic probabilistic measures of students' perceived integration, CI-CUB procedure has been implemented according to a twofold trajectory: results are presented graphically in Figure 1 where responses are aggregated by item subgroup and nationality. Notice that the parameter space is narrowed to improve readability, since a large part of the indicators lays in the uncertainty range $0.2 - 0.45$, and the agreement is always higher than 0.5. To save space, details about fitting procedure are not reported.

Left panel of Figure 1 shows the synthetic indicators for each item subgroup, corresponding to the above mentioned batteries (A, B, C, D), as compared with the overall CI-CUB indicator (ALL). For the items altogether (ALL), the level of agreement is quite high with a moderate level of uncertainty.

It seems evident that items referred to family attitudes (D) are those for which the overall level of agreement is the highest, immediately followed by those related to schoolmates (A), both manifesting a low level of uncertainty; estimates for the two subgroups pertaining to study habits (B) and assessments of relationships with teachers (C) get a lower agreement, with a larger uncertainty. Moreover, this representation allows to consider the impact on the overall indicator (ALL) of deleting one subgroup of items at a time. Specifically, removing B and C subgroups, the resulting synthetic indicators ($-$B and $-$C) show higher agreement and lower uncertainty, therefore highlighting the contribution of these two subsets in terms of *feeling*. These results are expected given the mutual positions of the subsets in the parameter space.

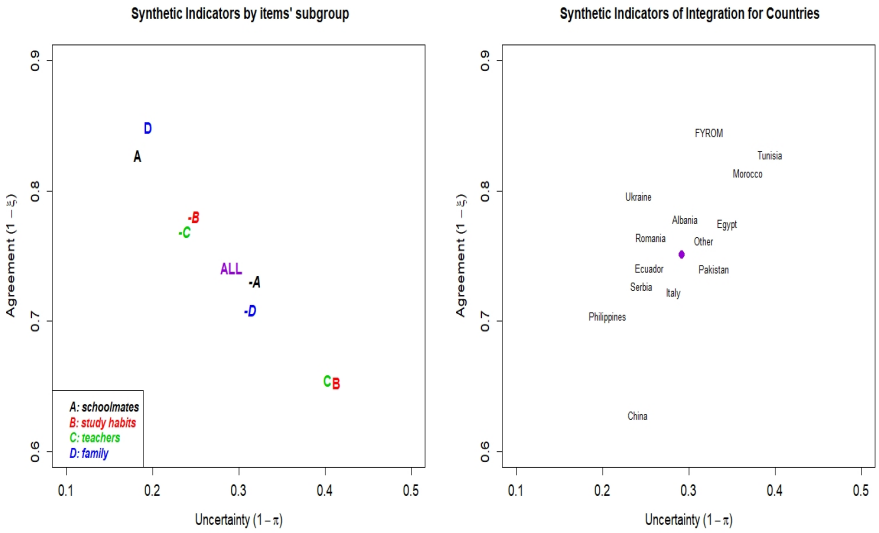

Fig. 1 Synthetic Indicators by item subgroups (left) and nationalities (right)

Right panel of Figure 1 collects CI-CUB indicators by respondents' nationality. In general, the agreement level is higher than 0.6 and the uncertainty spans between 0.10 and 0.43. Specifically, respondents from FYROM and Tunisia manifest the highest levels of agreement. Chinese respondents are quite far from the others in terms of *feeling*. Interestingly, Italian students express one of the lowest level of agreement, followed by respondents from China and Philippines. This finding is consistent with the so-called "Immigrant optimism approach" that assumes that immigrants are a positively selected group: individuals that leave the country of origin are supposed to be more motivated, ambitious, stronger and optimistic as compared to the national counterpart [6].

Table 1 CI-CUB estimated probabilities of the highest agreement

Nationalities	$Pr(\tilde{R}=5)$	Nationalities	$Pr(\tilde{R}=5)$
China	0.165	Egypt	0.308
Philippines	0.237	Romania	0.318
Italy	0.252	Albania	0.320
Serbia	0.260	Morocco	0.356
Pakistan	0.269	Ukraine	0.356
Ecuador	0.272	Tunisia	0.368
Other	0.295	FYROM	0.415

Table 1 presents the estimated probabilities to express the highest rating ($\tilde{R} = 5$), conditional to the nationality, which can be considered as an overall measure of educational integration, as derived by the CI-CUB models. In line with evidence in Figure 1 (right panel), Chinese students have the lowest estimated probability, whereas Macedonians (FYROM) have the highest. It turns out that there is not a clear geographical pattern of the estimated probabilities in terms of agreement, since different and distant countries present very similar estimated probabilities, see: Morocco, Ukraine and Tunisia, or Serbia, Pakistan and Ecuador.

Further developments of the study will follow two directions. From a methodological point of view, the main effort will be devoted to derive the confidence ellipses. For the empirical analyses, more investigation is needed on a geographical basis, as well as on the effects of individual characteristics, such as gender and migratory generation.

Acknowledgements The paper is included in the Research Program on "School inclusion strategies and social cohesion challenges of immigrate immediate descendants in Italy", SCHOOL/GEN2 (corresponding proponent Giuseppe Gabrielli), supported by grants from University of Naples Federico II (2017-2018), D.R. n. 408 07/02/2017 (CUP: E66J17000330001).
